A Shared Home: How to Live with Your Friends in VRChat

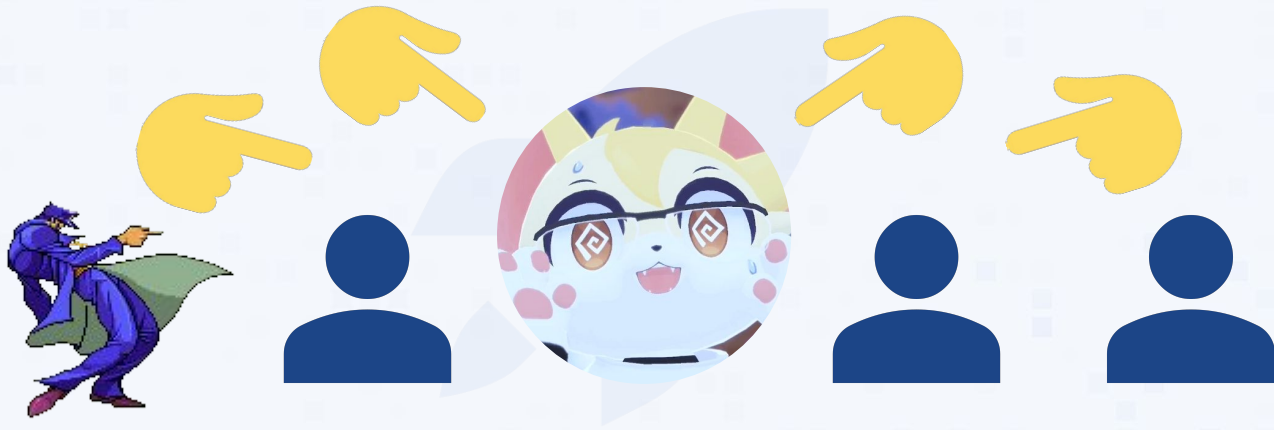

Getting Inside

VRChat-side

Hosting & Sharing With Everyone

Part 1: Hosting

Assign a **host**

They will have to do **everything**

...for setup

Getting Inside

What the host does?

- Creating the instance
 - Being the *Instance Owner*
 - Determining the instance type
 - Creating the link to the instance
- "Refreshing" the instance
- Creating a group (recommended but optional)
- Giving everyone access

Getting Inside

Instance Types

Acts slightly differently for living with friends

Invite

Will not work*

**unless the instance is unlocked (risky)*

Friends

Friends only

Also means friends you don't mean to include

Group

Members only

Requires  to create but recommended

Public

Don't.

For Invite+, Friends+, Group+

+ = "...and their friends"

Getting Inside

Instances will "expire"

All instances will end up "out of date"

Caused by:

- VRChat instance updates

Example: "The instance you are trying to join is on an older version" sometimes for non-PC or open beta users

- Specific world author changes

Example: The instance capacity **does not** change even if the world's capacity is updated!! ...*but changes inside the world itself should be fine (geometry, scripts)*

You will have to **close the instance** and re-make them **but not often!**

...or just re-make them without closing but your friends might use the old instance...

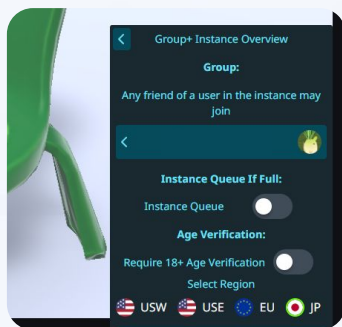

Getting Inside

vrchat.com/home

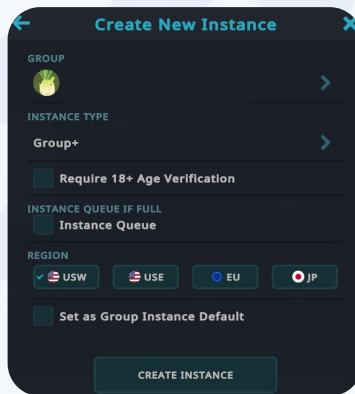

via **VRChat Website**

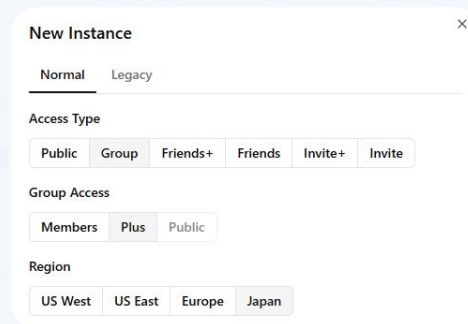

Time to host!

Create the instance!

Inside **VRChat**

A tool like **VRCX!**

Do this **later** if you have to do it inside VRChat!
We're still in the panel!!!

Getting Inside

Getting the instance!

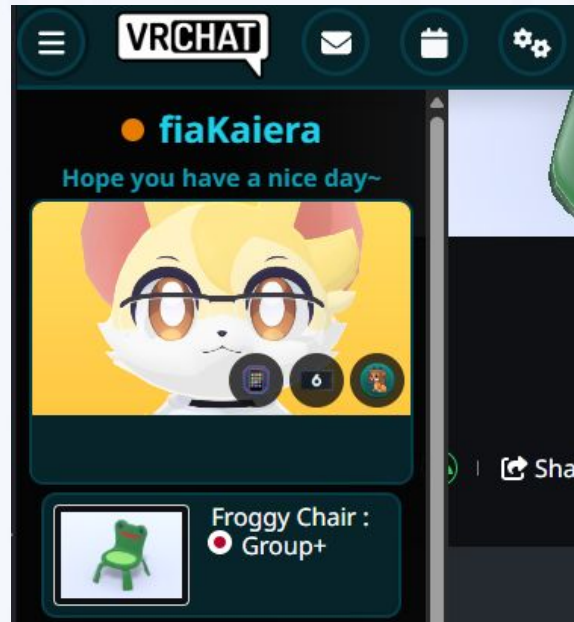

Coming from inside VRChat...

vrchat.com/home

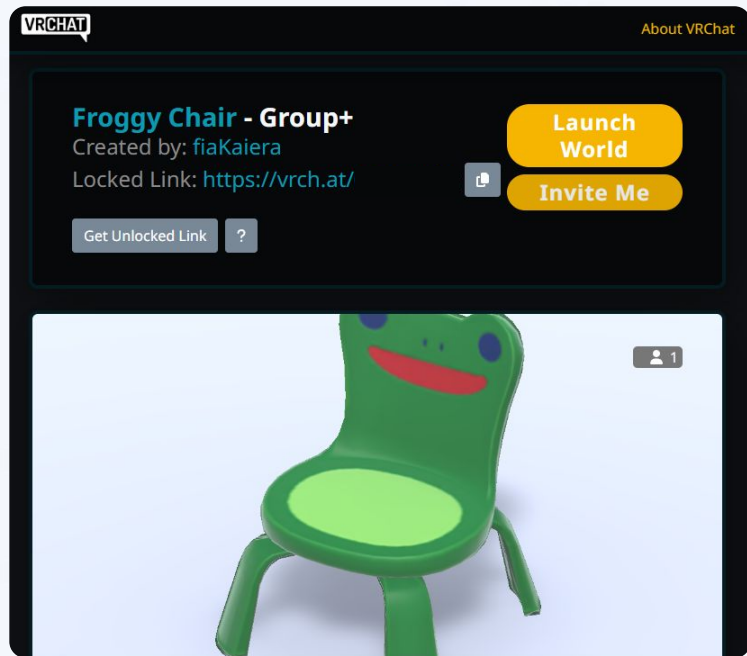

While you are inside the instance...

Click this ->

Getting Inside

You should get something like this...

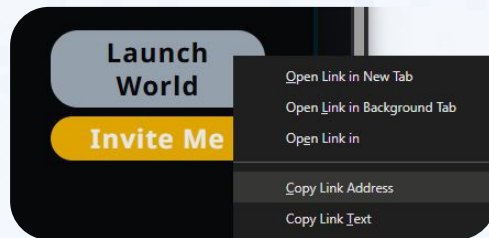

For sharing to non-PC Users:

- Copy the URL or the Locked Link
(URL is better should the locked link expire)

For sharing to PC users:

1. Right-click on "Launch World"
(or hold the button on mobile)
2. Copy the Link Address

The link should start with [**vrchat://**]

Getting Inside

vrchat:// protocol

Source (vrchat.com) World ID Instance ID

`vrchat://launch?ref=vrchat.com&id=wrlD_*****_****_****_*****:#####`
`~group(grp_*****_****_****_*****~groupAccessType(plus)~region(jp)&shortName=*****&attach=1`

Instance Type (Group+ JP Region) Unlocked ID for vrchat.com
(auto-generated, cannot be changed)

Basically...

this is how all the websites and tools launch VRChat!

Fun Fact:

Steam also uses **steam://** for games!

Tip:

You can replace the "#####" (different numbers followed by a "~private", "~friends" or "~group") this with another name that is alphanumeric without spaces (max 32) in the "https://" URL and going there before you copy for a custom name!

You **cannot** use the same name again if you **close** them on the same world & instance type, however.

Only  subscribers can ignore that restriction via creating the instance normally. (not using the URL)

Part 2: Sharing With Everyone

*"You are **invited** to my abode..."*

"So you don't have to ask me for invites again....."

Unless they block you ig...

Getting Inside

Note:

1. Will **not** be your home world.
(when you "Go Home" in VRChat, it will not be the given world)
2. You are **not** sent to the same instance if it is your home world.
(it will be on your own instance instead, therefore you cannot see them)
3. You will have to **use the link** to re-join,
unless if someone you can see is inside.
(instances are not visible if no one is in them or if fellow instance-mates are not on Online status)
Tip: Use a tool like VRCX if you want to back to previous instances.
4. You cannot join in if the instance is **closed**.
To home with you! >:/

Sidenote:

Me and my friends have a Discord server for private world updates so we do have a shortcut there if it's needed.

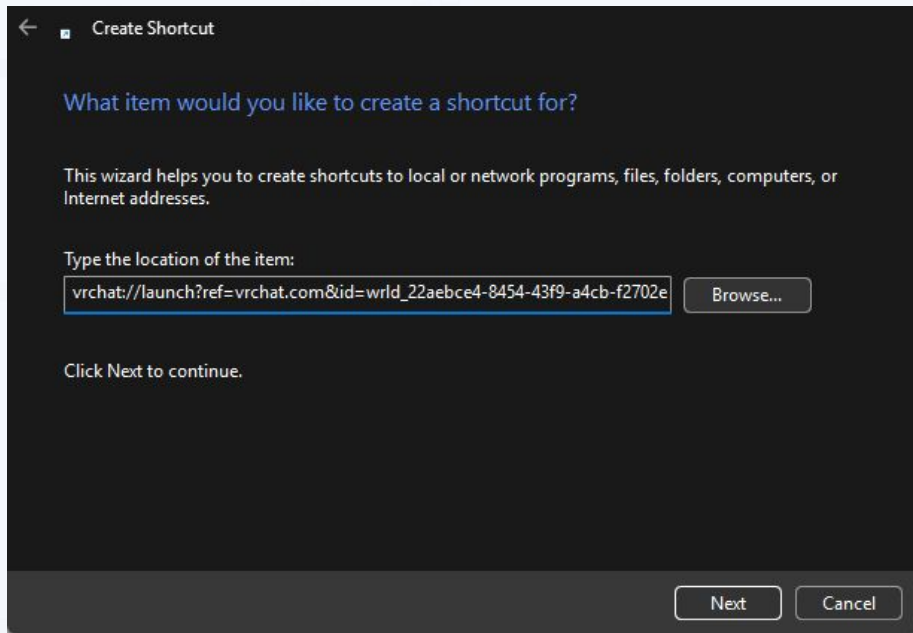

Getting Inside

On Desktop

1. Right-click on Desktop
2. New -> Shortcut
(under "Show More Options" on Windows 11)
3. Paste, Next, Finish
4. ???
5. Done!

Note:

If the link ends with `&attach=1`, it can also show instance details while in VRChat!

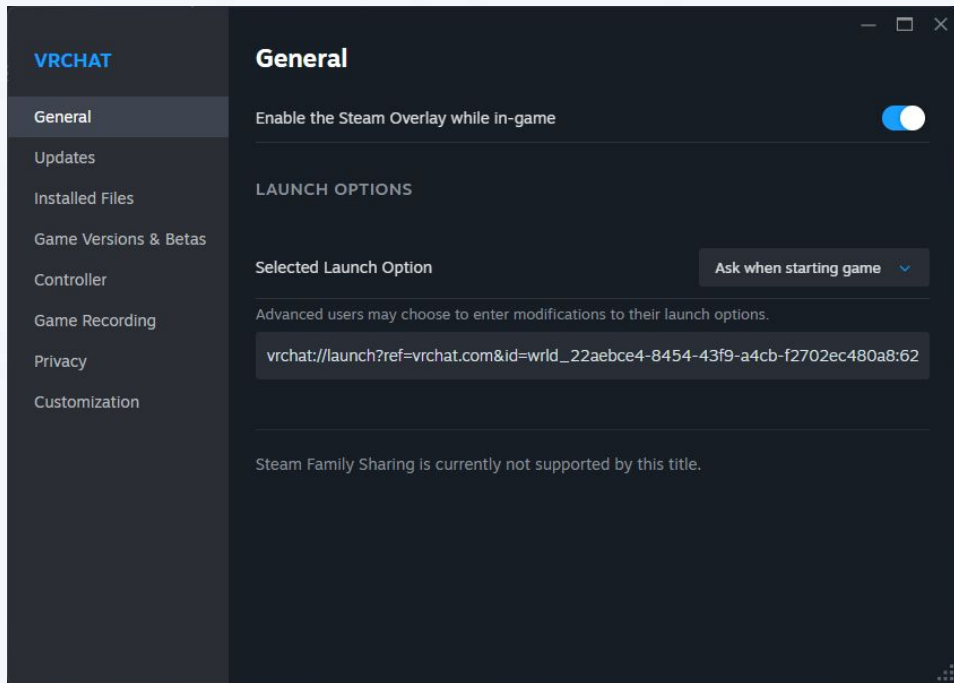

Note for Linux & macOS:

Set this as your launch argument for `Launch.exe` for VRChat instead.

Getting Inside

On Steam

or the Steam Deck / SteamOS

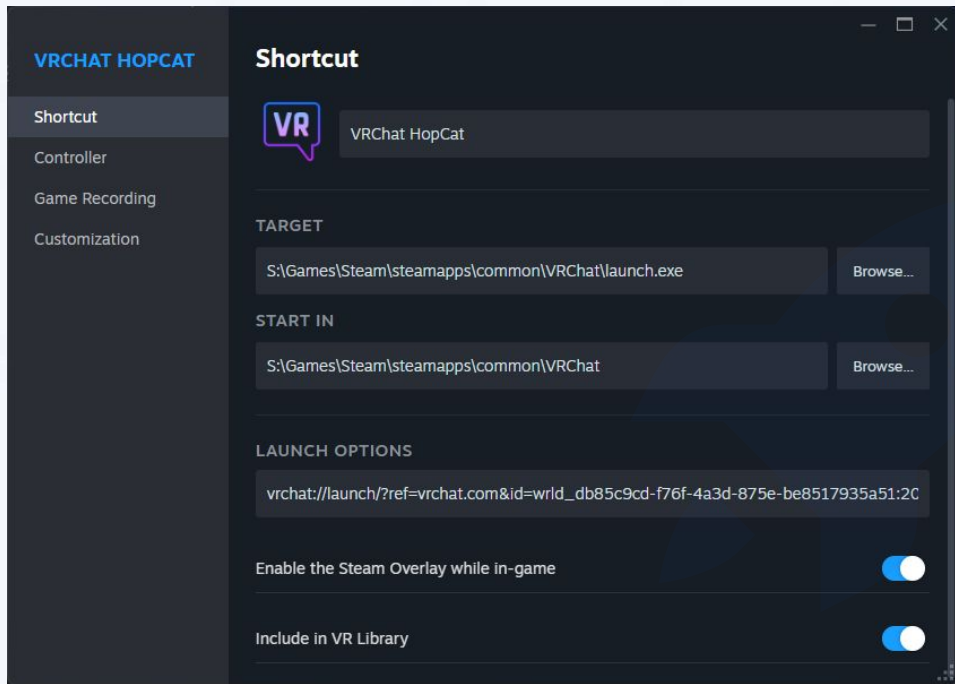

1. Right-click -> Properties
on VRChat in the Library
2. Paste link as Launch Option
3. ???
4. Done!

Note:

This will always boot up VRChat
You will *no longer spawn in your set home*
when starting, unless...

Getting Inside

On Steam (Separated)

or the Steam Deck / SteamOS

1. Right-click -> Manage -> Browse Local Files on VRChat in the Library
2. Note the location of the folder
3. In the Library, add a non-steam Game (found on the very lower left)
4. Select **launch.exe** from VRChat's folder
5. Paste the link as Launch Option (or Target... both do the same)
6. Done!

Turn on **Include in VR Library** to open it from SteamVR!!
Add "**--no-vr**" before the link in Launch Options to disable VR

VRChat for Mobile is a bookmark...

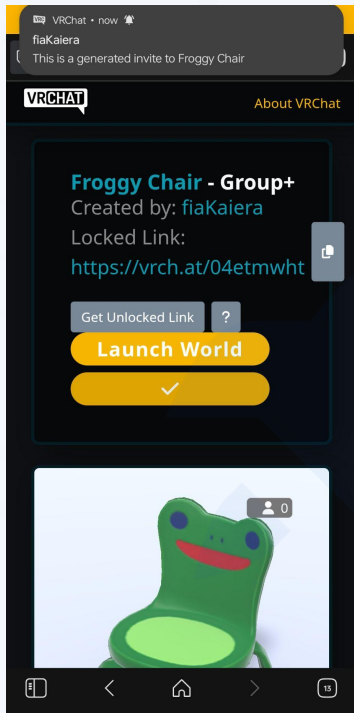

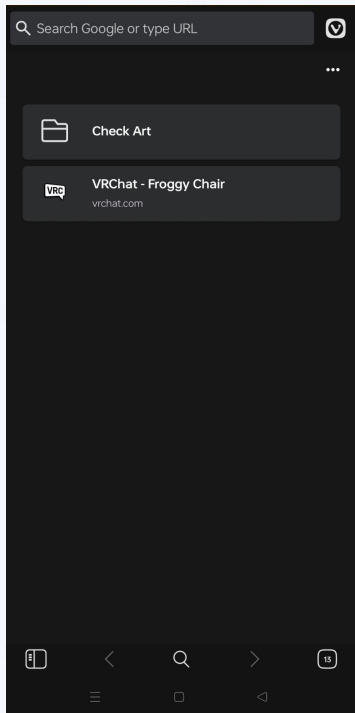

VRChat is **not** setup
to run **vrchat://** on mobile.

:/ indeed...

VRChat-side

Sharing With Everyone

A Shared Home: How to Live with Your Friends in VRChat

Getting Inside

On Android / iOS

1. Add the given link as a bookmark and put it on your "Featured Bookmarks" list if any
2. Launch the VRChat app if not opened already
3. Invite Yourself via the bookmark
(it should show as a popup)

Getting Inside

For Android

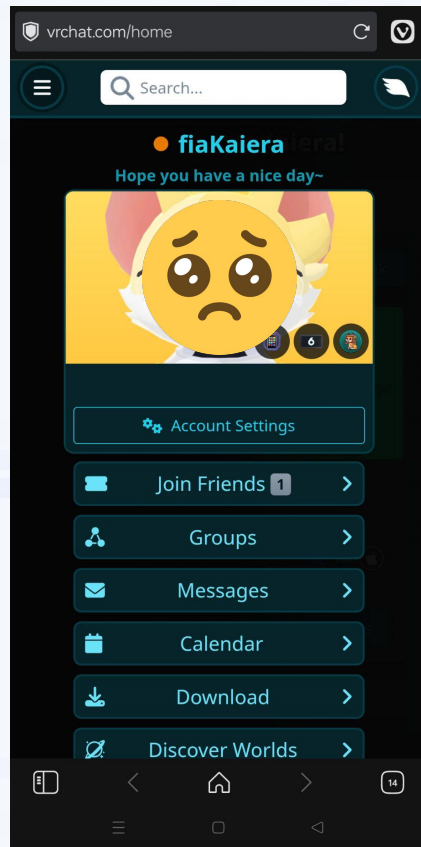

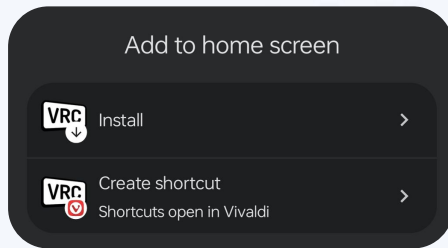

"Add to Home Screen"
is clunky...

It only leads you to vrchat.com/home
instead of the instance.

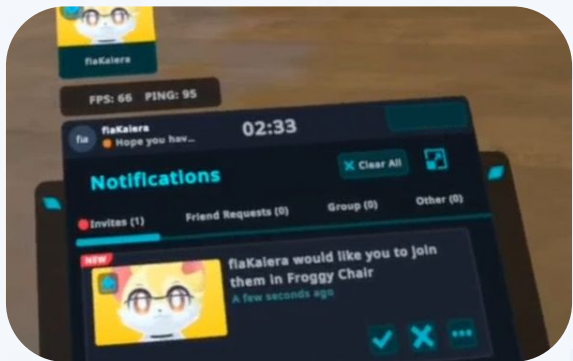

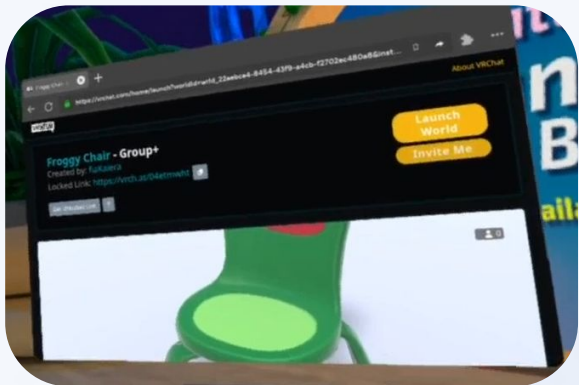

Why?

It treats the browser shortcut as a
"progressive web application", so it strips
all the extras on the link...

You will have to find a "Website Shortcut"
app instead.

Getting Inside

On Quest

You can also use the same methods through the web browser.

Except, you're just inviting yourself within VRChat this time. 🙄

At least you're not waiting for anyone else...

Yes, I do use a Quest 2... via Virtual Desktop.

What else is this good for?

Pretty much anything that involves multiple people in one place constantly...

like **event spaces!**

*(Only one-instance events... as it doesn't work on instance queues.
...and if you don't close the instance.)*

The Magic of a Village

World-building

How It Works & Considerations

The Magic of a Village

Part 1: How It Works

Note:

This section will delve a very small bit of **Udon**, just way simplified so you can understand what's happening.

Unique Spawnpoints

1. Get the player's **display name**
2. If it is them "TeleportTo()" them after a small delay

Ideally after **10 frames**

(1/10th of a second in 60fps)

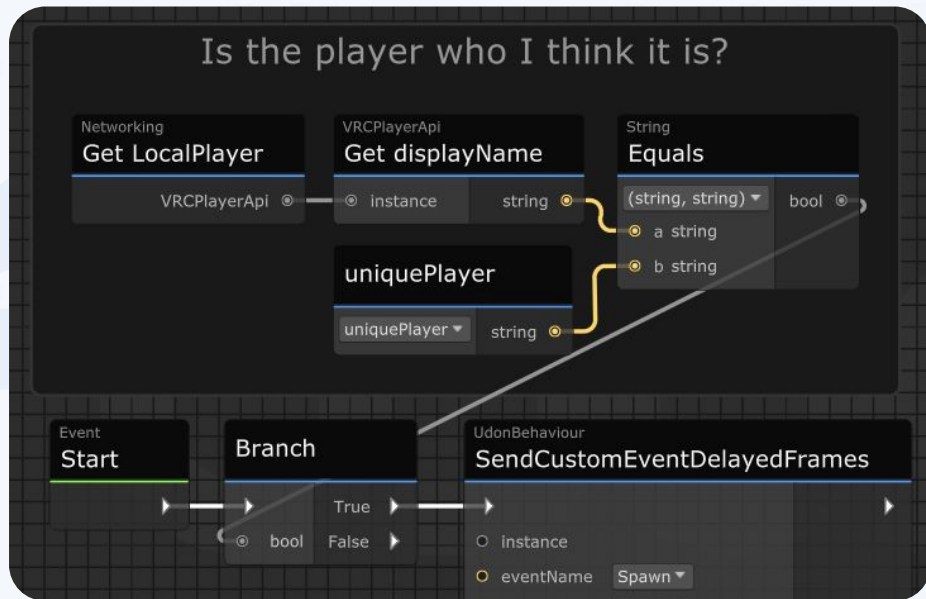

The player will fail to teleport if you do it immediately or too fast.

← Full examples **here!**
(It ended up being too big.)

The Magic of a Village

Udon Graph

Udon#

```
if (localPlayer.displayName == playerName)
    SendCustomEventDelayedFrames(nameof(Spawn), FRAME_DELAY );
// Use localPlayer.TeleportTo() inside Spawn() after
```

The Magic of a Village

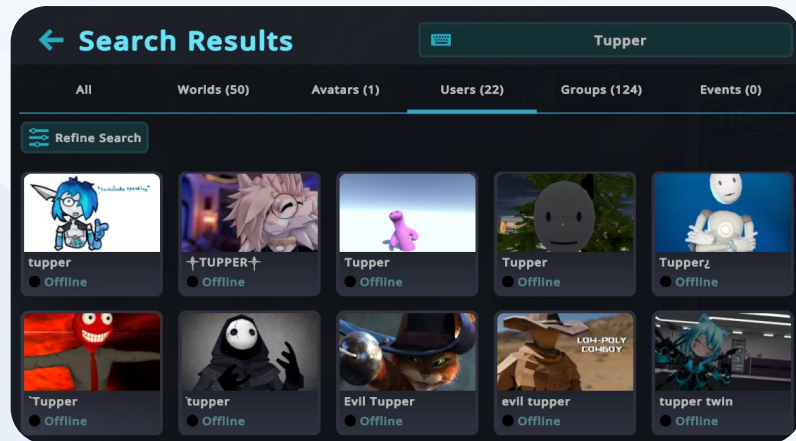

Unique Spawnpoints

Downside

1. Players changing display names
2. Players using the old display name

NOTE:

Udon **cannot** grab user IDs and usernames
(Which I'm pretty sure it's for security purposes)

The Magic of a Village

Solution: PlayerData

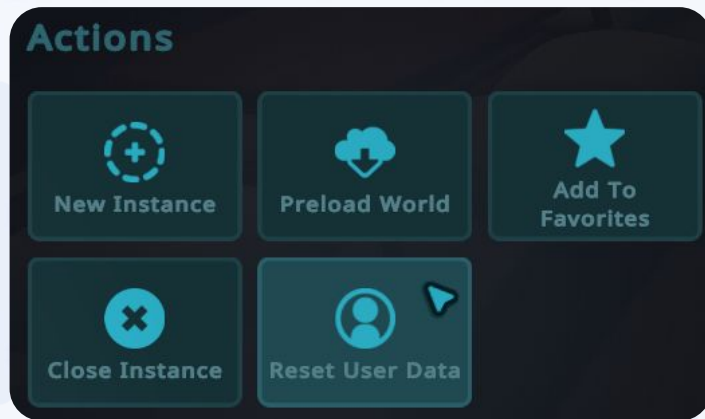

Basically, PlayerData are per-world "cloud save files".

Introduced in November 2025!

NOTE:

Udon **cannot** grab user IDs and usernames
(Which I'm pretty sure it's for security purposes)

Downside:

...or when save data isn't saved
...or if PlayerData gets corrupted or
wiped at some point

← Examples **here!**
(There's multiple ways of doing it!)

The Magic of a Village

We do have **tools!**

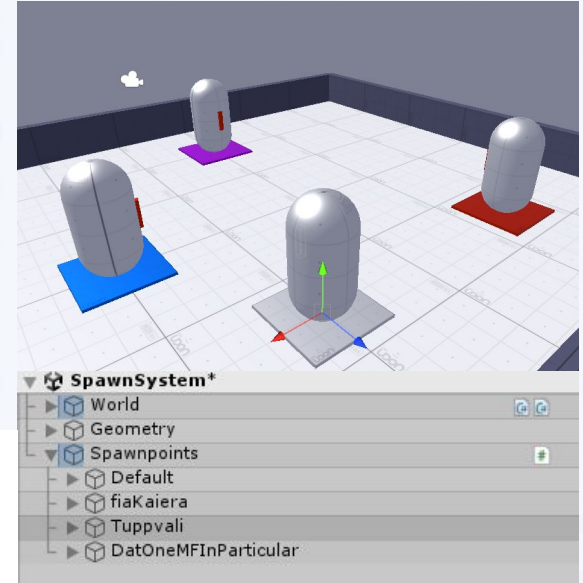

<https://aikatsuyuri.booth.pm/items/4486666>

[Udon Graph] Dynamic Personalized Spawn System

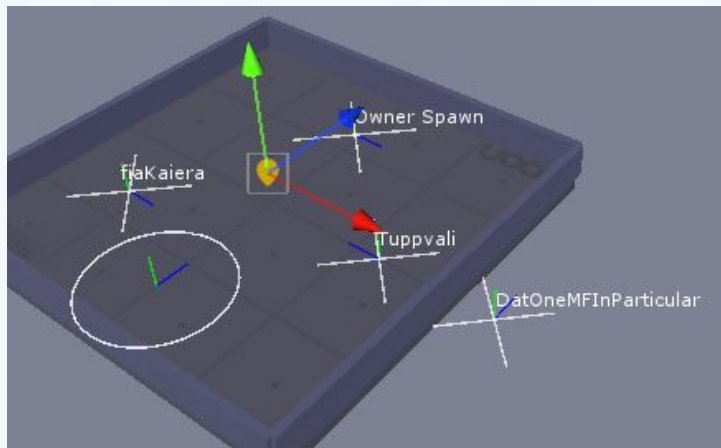

AiTech Dynamic Personalized Spawn System | Version 1.02

← All links are easily accessible **here!**

The Magic of a Village

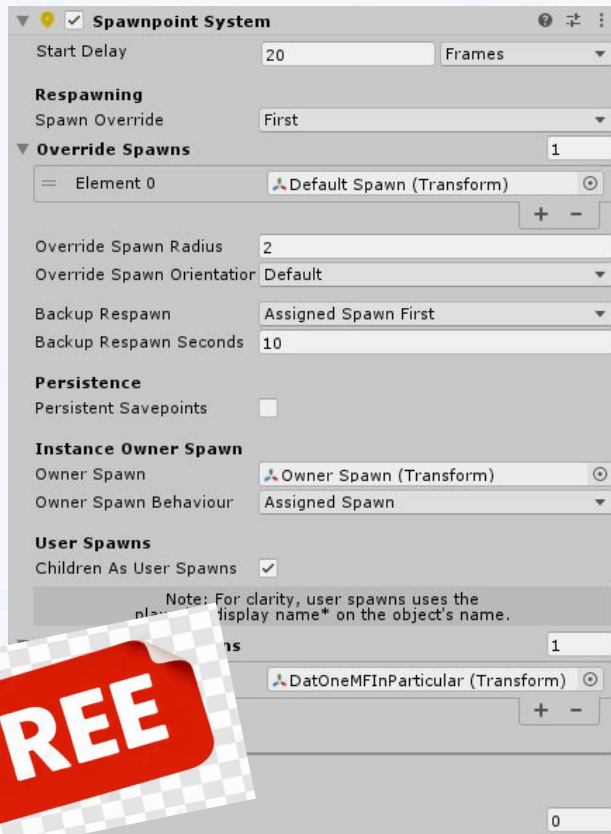

Kaiera's Unique Spawnpoints

Notice:

This is not #AD... It's really just a tool I'm proud of making that I want to share to the public... so maybe it is...

← All links are easily accessible **here!**

The Magic of a Village

Part 2: Considerations

Even so, you're still making a VRChat world.
...and yet with a purpose.

The Magic of a Village

Listen to your residents.

Ask what they want in a home to make it theirs.

...but don't overdo everything. People will understand.

- Have consistent furniture, especially for a small world file size
- Doing everything at once will burn you out
- For the technically inclined and if you're brave enough, you can make a whole custom furniture system thanks to persistence

Technically, you are the HOA...

The Magic of a Village

Privacy is important.

Some like to keep what's theirs safe.

- Access Prevention *(very important for Public)*
- Audio / Voice Zones
- Visibility Zones
- Anti-peeking

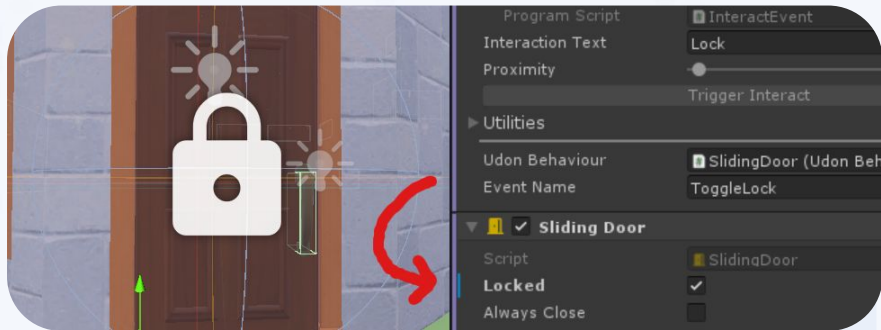

BOTTOM TEXT

The Magic of a Village

Access Prevention

If it's not them, don't let them.
Simple solution: Just lock the doors.

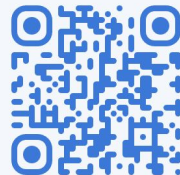

Audio / Voice Zones

You can separate rooms far away or
do Udon scripting magic to isolate voices.

For Voice Zones, there is a powerful tool for this: **Udon Voice Utilities**
<https://github.com/Guribo/UdonVoiceUtils>

The Magic of a Village

Visibility Zones

Literally hide (not cover) the stuff if they are not there or if no one is there.

Anti-peeking

You can use Post-processing Volumes to hide visibility. Alternatively, try to block their view and/or the camera.

The Magic of a Village

Optimization is **very** important.

Try to achieve as much FPS when you can.

- Try to aim for **Max FPS** for **solo in VR**
 - If not, at least **60 FPS** or **75 FPS**
 - For Desktop only, note VR is rendered 3x than normal (screen, left eye and right eye)
- As soon as people come in
The FPS can **quickly go down** depending on an avatar's performance...
Example: 60 FPS in VR -> **29 FPS** with 11 people on a friend's setup

Try and not follow this:

Performance Tips

- Aim for at least 45 FPS with a single VR user at the spawn.

From: VRChat Creation Docs

IMPORTANT:

LOW FPS IN VR CAN AND WILL CAUSE **NAUSEA**

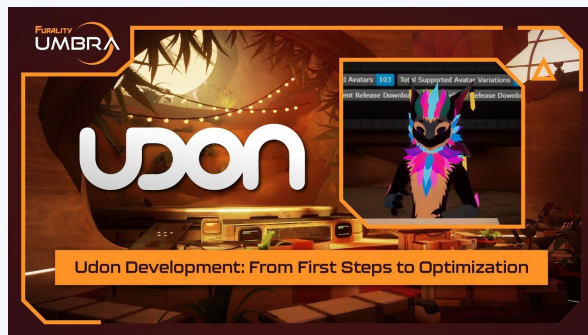

The Magic of a Village

Optimization is **very** important.

...but it's not the main topic of this talk.

by MyroP

by Happyrobot33

...and more!

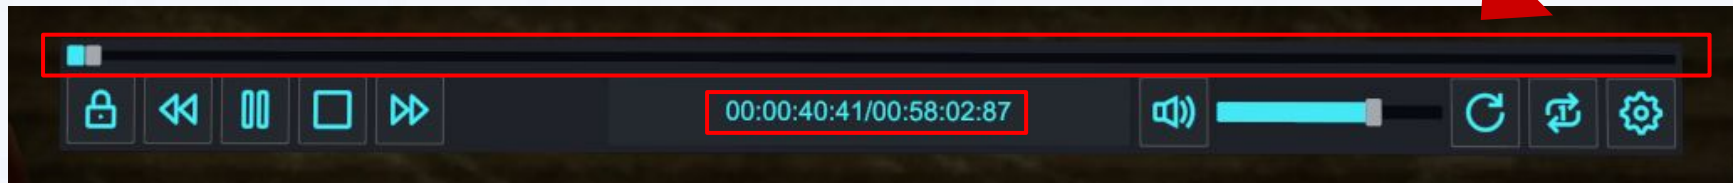

← All easily accessible **here!**

FF14 low-poly grapes my beloved...

The Magic of a Village

Be careful of placing video players...

These update **every frame for each one** even when **disabled!** (Many video players do this!!)
Keep one*, **teleport** them, and do **NOT** place multiple copies!

*Multiple screens are fine, except when they hide UI (YamaPlayer, VizVid, etc.)
It's only parts that update video progress visually affect performance

← All easily accessible **here!**

A Shared Home: How to Live with Your Friends in VRChat

Summary

Summary

Getting Inside

VRChat-side

- Copy a link from vrchat.com/home
- Make a shortcut on your PC

The Magic of a Village

World-building

- Use Unique Spawnpoints
- Do not forget the ice cream
- Respect Privacy
- Low FPS can make people sick

← More info as always **here!**

*Sometimes, just having a place to call **home**
can sometimes have an impact on how we interact
with each other.*

To hang out with, and not just a party every weekend.

*Let's make **#SharedSpace** worlds for those who can't make homes but
want for creatures who live far away to be even closer~*

A Shared Home: How to Live with Your Friends in VRChat

Thanks for coming~!
